Hiring Manager

Re: Forward Deployed Engineer

Dear Hiring Team,

I am applying for a Forward Deployed Engineer role because the work matches the way I have created value throughout my career: step into complex environments, understand what is really blocking progress, and build the technical path that gets teams to a working outcome. Across 16+ years at Microsoft and IBM, I have operated at the intersection of production operations, escalation leadership, cloud engineering, and AI-enabled automation, consistently translating ambiguous operational problems into stable delivery patterns.

In my current Microsoft role, I serve as the bridge between urgent operational reality and engineering execution for mission-critical support services. I designed AI-driven incident automation integrating ICM, Application Insights, Log Analytics, Azure DevOps, Kusto, SQL Server, Cosmos DB, and Teams workflows; streamlined 500+ noisy alerts; remediated 25,000+ stale or false incidents; authored 175+ troubleshooting guides in 5 months; and helped improve operational efficiency from 85% to 98%. That combination of hands-on systems thinking, delivery ownership, and stakeholder communication is the core of modern forward deployed engineering.

I also bring the customer-facing judgment that strong FDE teams need. Earlier in my Azure support leadership work, I partnered directly with enterprise users and internal stakeholders on migration, subscription, identity, and capacity issues where technical decisions had direct business impact. I learned how to simplify complexity, sequence delivery, push back constructively when needed, and convert field pain into actionable product feedback without losing momentum.

I would welcome the chance to bring that blend of engineering depth, ambiguity tolerance, AI workflow fluency, and customer-centered execution to a Forward Deployed Engineer role. I am especially motivated by opportunities where embedded engineering can accelerate adoption, reduce time-to-value, and turn real-world constraints into repeatable product and platform improvements.

Best regards,
