Hiring Team

Re: Technical Program Manager

Dear Hiring Team,

I am applying for Technical Program Manager opportunities because the role aligns closely with how I have created value throughout my career: combining technical depth, operational judgment, and cross-functional leadership to deliver measurable outcomes in complex production environments. Across 16+ years at Microsoft and IBM, I have led critical support, reliability, automation, and cloud operations work that required both hands-on execution and clear stakeholder alignment.

My background includes mission-critical service operations, Azure platform work, escalation leadership, incident and telemetry-driven automation, and the design of repeatable playbooks that improve quality and speed. I have led teams of up to 32 engineers, improved operational efficiency from 85% to 98%, reduced resolution time by 32%, streamlined 500+ noisy alerts, remediated 25,000+ stale incidents, and built AI-assisted workflows that introduced 30-35% automation potential into operational response paths.

What I would bring to a Technical Program Manager role is a pragmatic combination of engineering fluency, systems thinking, and delivery ownership. I am effective in ambiguous environments, comfortable driving decisions with data, and disciplined about turning repeated operational pain into scalable improvements rather than one-off fixes.

I would welcome the opportunity to discuss how my experience across Azure, operations, automation, reliability, and leadership can support your team and accelerate meaningful outcomes in a Technical Program Manager capacity.

Best regards,
